

developed and distributed by the new generation of equine veterinarians and equestrian professionals

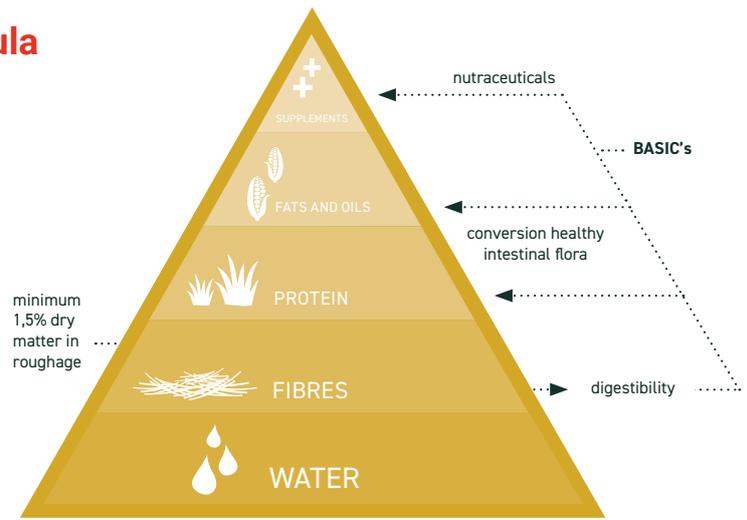

EquilinCOMFORT, the stomach relax formula

COMFORT is a BASIC

The main ingredients of BASIC are: magnesium, vitamin E, MSM, plant-based omega 3 fatty acids (DHA and EPA), essential amino acids, pre- and probiotics and a mycotoxin binding agent. In COMFORT, we have added to this: liquorice root, camomile, and FOS (inulin)

COMFORT is developed to be fed daily to the horse, alongside sufficient (preferably analysed) suitable roughage (max 1 hour without, using slowfeeders if necessary) and a complete vitamin and mineral supplement (for example EquilinBALANCER) and minimal to no concentrates. It should be fed for a minimum of 6 weeks. Results can be optimised when any stress stimuli are also removed.

Due to the higher build-up dose during the first 3 weeks, one horse will need 2 bags for the first six weeks. After that, one bag per month should suffice for an adult horse. At times of increased stress, the build-up dose can be given for a few days.

Equilin® nutritional pyramid ©

The product can be fed continually; however, an occasional short stop period of 7 days is recommended. Two days before competition you should stop feeding COMFORT for 2 days and switch to BASIC, because of FEI regulations. COMFORT does not contain a complete vitamin and mineral complex, so it can be fed alongside any diet.

OBSOLETE SUPPLEMENTS IN ADDITION TO COMFORT

- Linseed oil or other Omega 3 oils
- Magnesium
- Vitamin E in healthy horses
- Muscle support supplements
- B vitamins and biotin, made by healthy intestinal flora
- Calming supplements

SUPPLEMENTS THAT MIGHT BE USEFUL

- A treatment of IMMUNO in the spring and autumn
- GLUCO or other joint support products
- RECOVER and salts
- Any specific supplements recommended by your veterinarian based on a diagnosed condition.

Many (herbal) supplements put extra strain on the liver, and the liver is crucially important for the proper digestion of the whole diet. 'It doesn't hurt to try' is hardly ever the case! Therefore, always consult an expert before use.

EquilinCOMFORT

DOSAGE AND INGREDIENTS

DOSAGE	Build-up *	Maintenance Sport / indication
Horse	350 - 450 g	200 - 250 g
Pony	250 - 350 g	150 - 200 g

* Build-up dose during 3 weeks. In times of increased stress or heavy work, the daily dose can temporarily be increased to the build-up dose for a few days.

Store in a cool and dry place.

400 g and 6,3 kg | Bulk 3x 6,3 kg at a 10% discount

BEVAT ONDER ANDERE:

Contents: Apple pulp, babyrice germinated rice, linseed flakes, carob flour, linseed fibres, alfalfa, apple molasses, liquorice root, sunflower oil, beetroot pulp, lecithin, ground herbs, Icelandic moss

Analytical components/kg: EWpa 0,57, crude protein 14,0%, Crude fat 5,8%, crude fibre 12,5%, crude ash 12,4%, calcium 20 g, phosphorus 2,5 g, sodium 1,2 g, magnesium 17,5 g, sugar 70 g

Added /kg Antioxidants: (C) 1b306(ii) high tocopherol extracts of natural origins 16 mg

Binding agents: Bentonite-montmorillonite (1m558i) 16.5 mg, Kieselguhr (purified diatomaceous earth) (E551c) 0.4 mg

Trace elements: 3b607 zinc (Zn-chelate from glycine hydrate) 264 mg, 3b506 manganese (Mn-chelate from glycine hydrate) 264 mg, selenium (3b8.12 Se-organic CNM I-3399) 1 mg

Vitamins: 3a300 Vitamin(e) C 4200 mg, 3a700 (RRR-alfa-tocopherol) Vitamin(e) E 2850 mg, DHA (Omega 3) 5000 mg

Intestinal flora stabilisers: 4b1702 Saccharomyces cerevisiae Sc47 230000 MCFU/kg

SIDE EFFECTS

- None known. Individual hypersensitivity to a specific ingredient could however always occur. Horses with kidney failure could experience problems with high blood values of magnesium, but generally the horse has to be really ill for this to occur. Consult your veterinarian before use.
- Avoid oral co-administration of Macrolides (certain antibiotics), as they will attach to the mycotoxin binding agents, which will make the antibiotic less effective.

- Caution, this antibiotic is only given as a third-choice for foals with a diagnosed bacteria.

COMFORT contains herbs, and therefore the FEI advises to stop 2 days before competition and switch to BASIC.

In the majority of all horses and ponies that are fed BASIC's, one or more of the following improvements can be seen within 3 to 5 weeks:

- A very nice sheen and intense coat colour
- Improved endurance
- Increased recovery after work (less stiff the day after training)
- Lower heart rate both in rest and during work
- Better musculature, topline and suppler movements
- Lower muscle tone overall, more relaxation

- Improved faecal structure
- Slimmer in the flanks, less bloated
- Calmer, less anxious and more stable in behaviour
- Better hoof quality
- Less sensitive to stress

Should a horse respond insufficiently to the BASIC's after the first six weeks, there is often an underlying cause. Contact us or your veterinarian. Are you interested in everything involved with proper digestion and nutrition? Then our book 'the New Feeding Concept' is for you!
